

Flex Microform .11

A versatile and invisible way to collect & protect sensitive card information

Overview

You are ultimately responsible for keeping your customers' payment information safe. And the costs of failing to meet card security standards—or recovering from a card information breach—are unacceptably high.

CyberSource Flex Microform .11 gives you an easy, flexible way to secure your customers' sensitive payment information—from the moment they enter their card details until the purchase is completed.

Flex Microform protects every transaction by allowing you to embed hosted card information fields directly into your existing checkout page. When customers click submit, their card information is encrypted, sent directly to the CyberSource payment gateway and tokenized, without ever coming in contact with your e-commerce platform.

Bring advanced card information security to your online business—without disrupting your checkout experience or getting in your customers' way.

→ **Keep card information secure through the entire transaction process**

Because Flex Microform embeds hosted payment acceptance fields directly into your checkout page, sensitive card information is protected from the moment customers enter it. This eliminates the risks of man-in-the-middle attacks, payload injection attacks and other advanced threats.

→ **Boost compliance with PCI-DSS**

By having CyberSource accept and handle sensitive payment information on your behalf, you reduce your exposure to PCI-DSS and enhance your ability to qualify for PCI SAQ-A assessments.

→ **Avoid exposing your e-commerce platform to payment information**

With Flex Microform, your e-commerce platform never stores, processes or interacts directly with sensitive payment data. This frees your internal staff to focus on providing better customer experiences and growing your business.

→ **Provide seamless, invisible integration with your existing checkout experience**

Flex Microform only hosts the specific fields that contain sensitive payment information—and those fields are fully customizable. That means you get all of Flex's security benefits with zero impact on your customers' shopping experience.

Flex Microform .11 is available to current CyberSource customers free of charge. It's one more smart reason to choose CyberSource as your payment platform.

Key features

Embedded, CyberSource hosted iframes that securely capture and transmit sensitive payment information without impacting customers' checkout experiences.

Upgraded security capabilities, including short-term, mathematically irreversible tokens, CVV capture, signature-verified interactions and more.

Advanced tokenization method that encrypts sensitive data on customers' devices before it's transmitted to CyberSource via HTTPS.

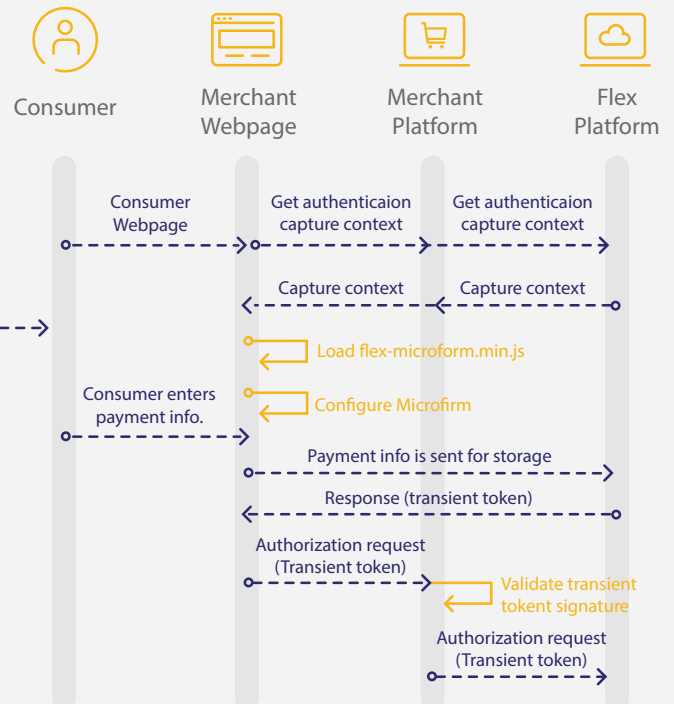

Complete JavaScript library and flex APIs that allow you to embed secure input frames that look identical to the other fields in your checkout process.

* Fully PCI SAQ-A certified

How it works

- 1 You use the Flex JavaScript library to replace sensitive card information fields with secure, CyberSource hosted iframes.
- 2 The hosted field captures card information on your behalf, encrypts and tokenizes the data, and sends it directly to the CyberSource payment gateway.
- 3 Irreversible short-term tokens, single-use encryption keys, signature-verified interactions and other advanced security technologies provide complete, end-to-end protection.
- 4 Iframe customization makes it easy to match the look and functionality of your existing shopping experience.
